Component Diagram:

Brief:

This is a component diagram for the project - Community Lost and Found Matching Network. The subsystems are: Listings, Matching and Claims. The external system is: Email Service. The subsystem Listings takes care of searching, listing new items and authentication. Matching consists of a matching engine that compares between the existing records of listings to find matches and alert when found. Identity is also verified whenever claims are made for items (to ensure that the right owners receive the items on being found, as well as to ensure that false listings and claims aren't made), by authentication. Communication for the same can be facilitated by the email service system as listed above aside from the listings view on the webpage.

Explanation:

As depicted in the diagram, the user - either a finder/owner, can browse/list items with the proper accompanying authentication (login/register). A community moderator will ensure the moderation of all the processes. Whenever there's a match (as found by the matching engine), the claims are verified by authentication to ensure safety against false listings as well as false claims. After this process, the verified matches will then be notified and the communication process will be facilitated by the email system (as listed to be an external system).
