SE LAB2 :

Name: Aniyath Amrita Pradeep

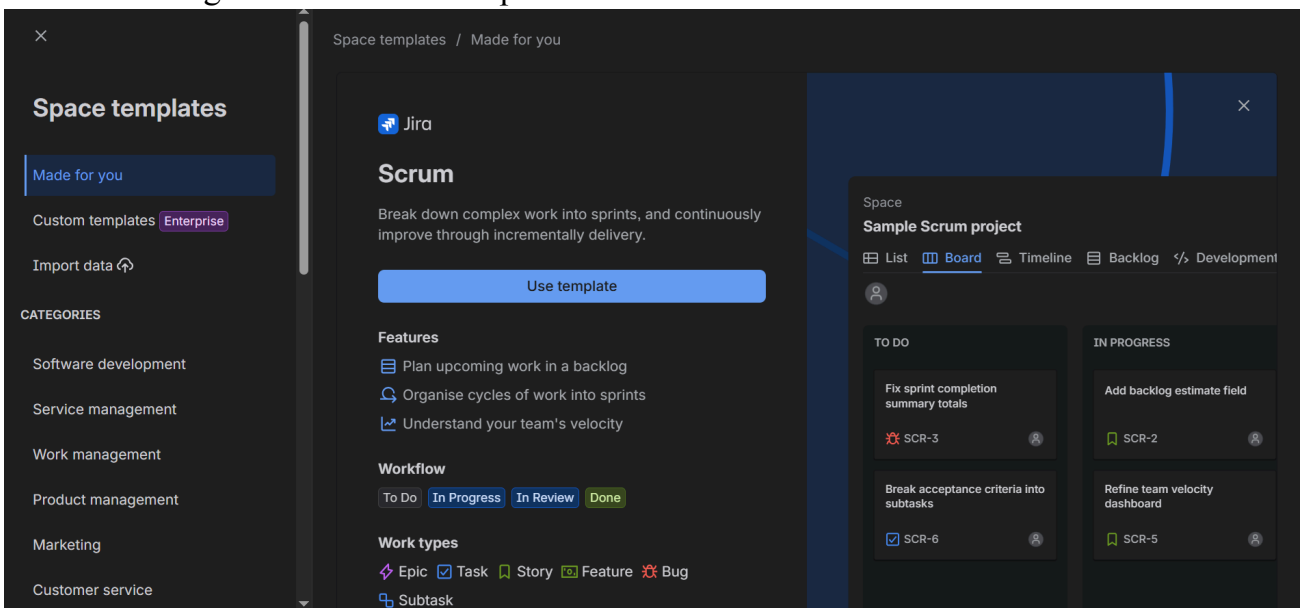

SRN: PES2UG24CS919

Sec: H

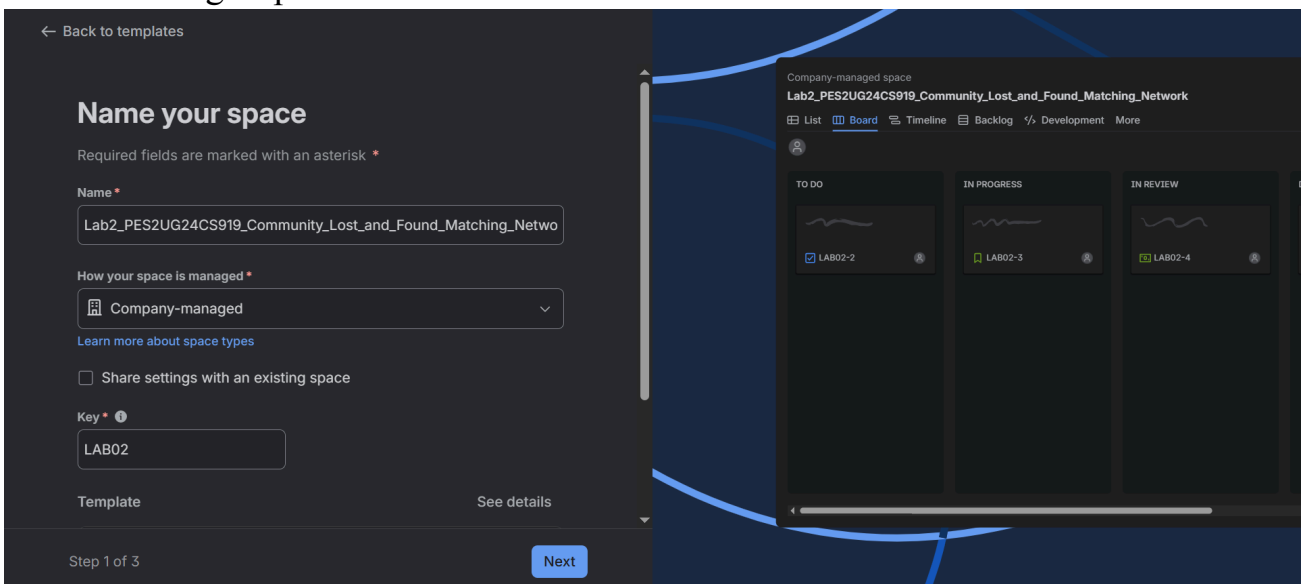

PROBLEM STATEMENT : 59 - Community Lost & Found Matching Network

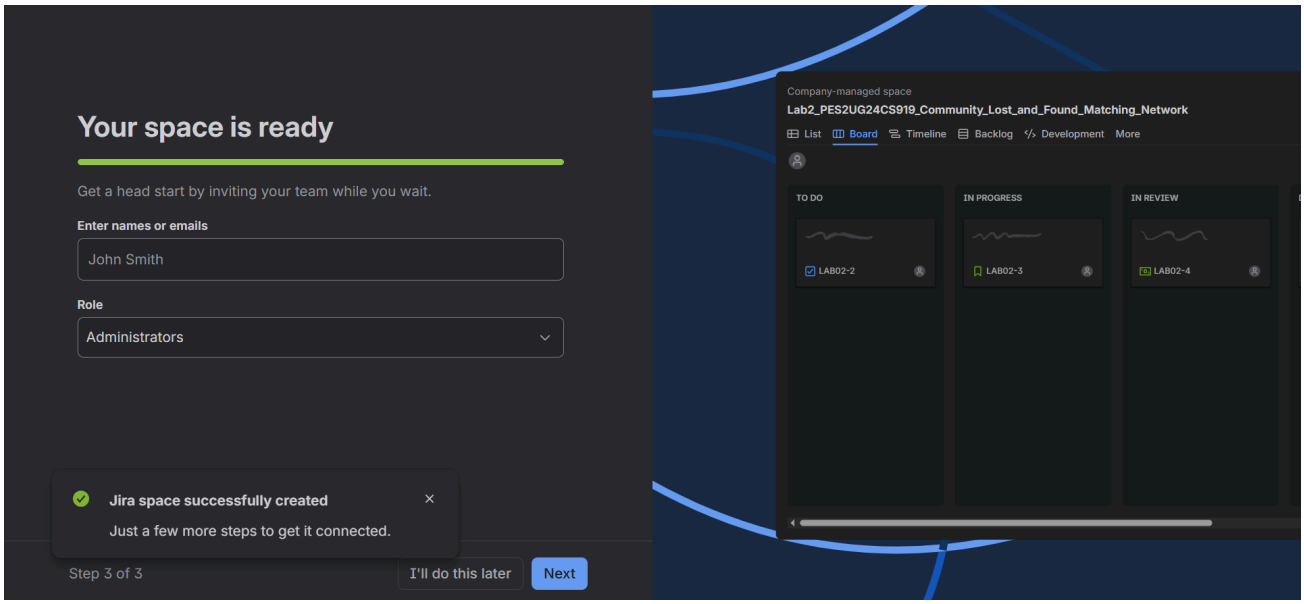

Initial Jira setup :

1. choosing SCRUM as the template:

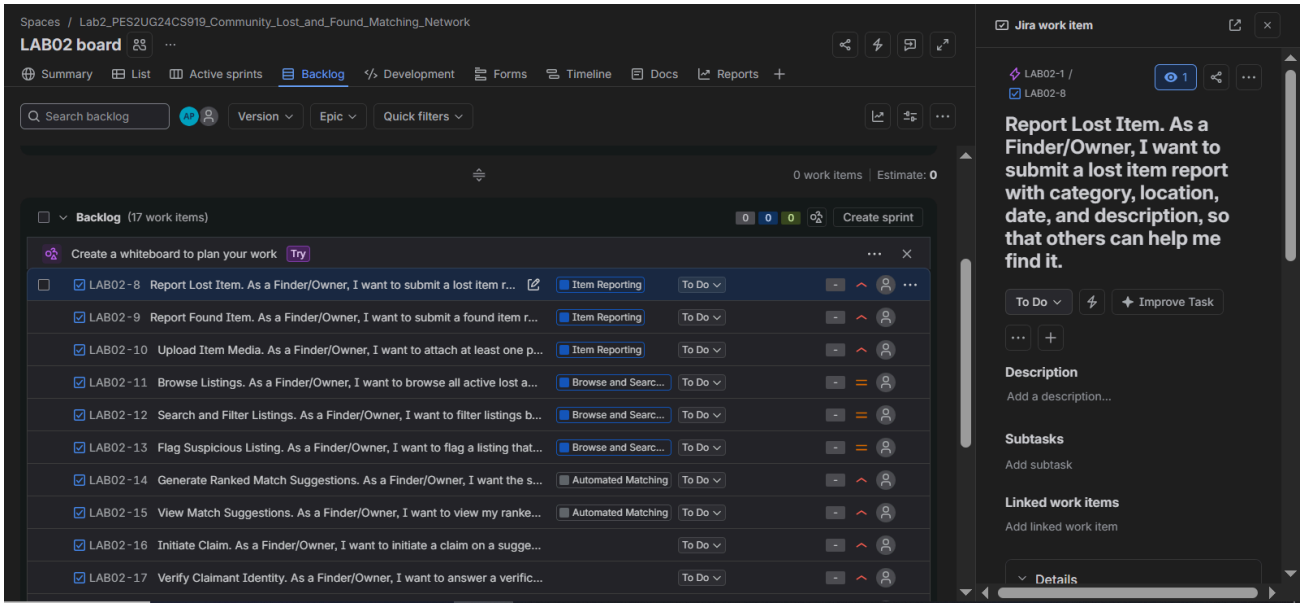

2. Creating a space

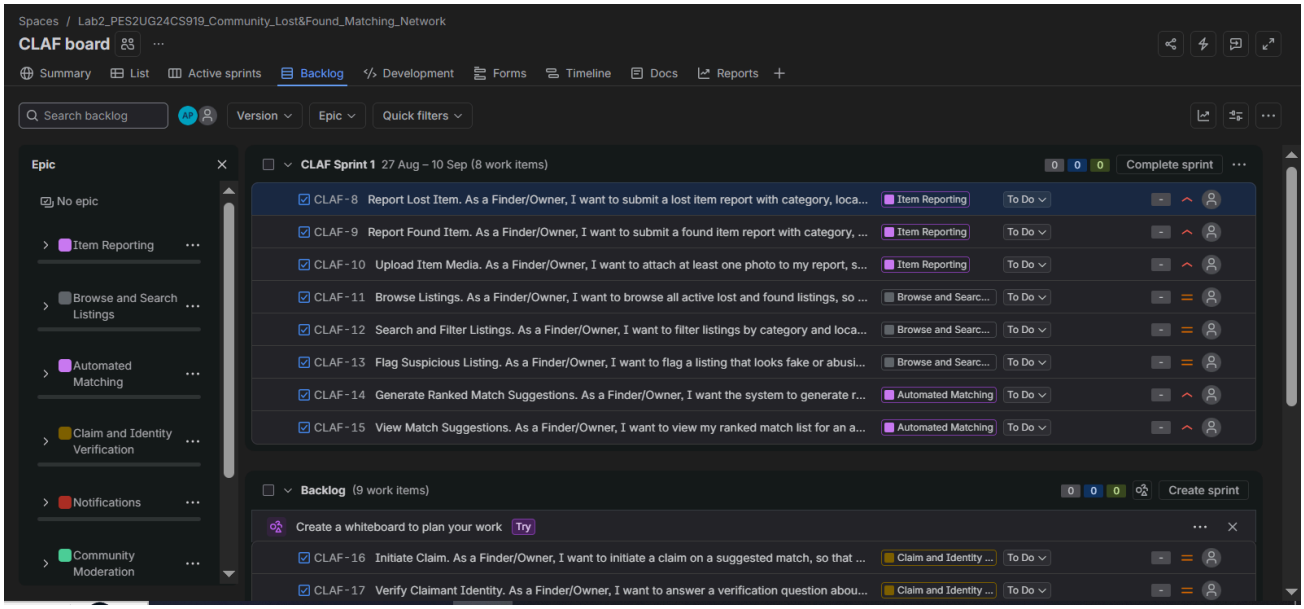

3. The initial backlog shows the created user stories with their respective priorities and story-point estimates.

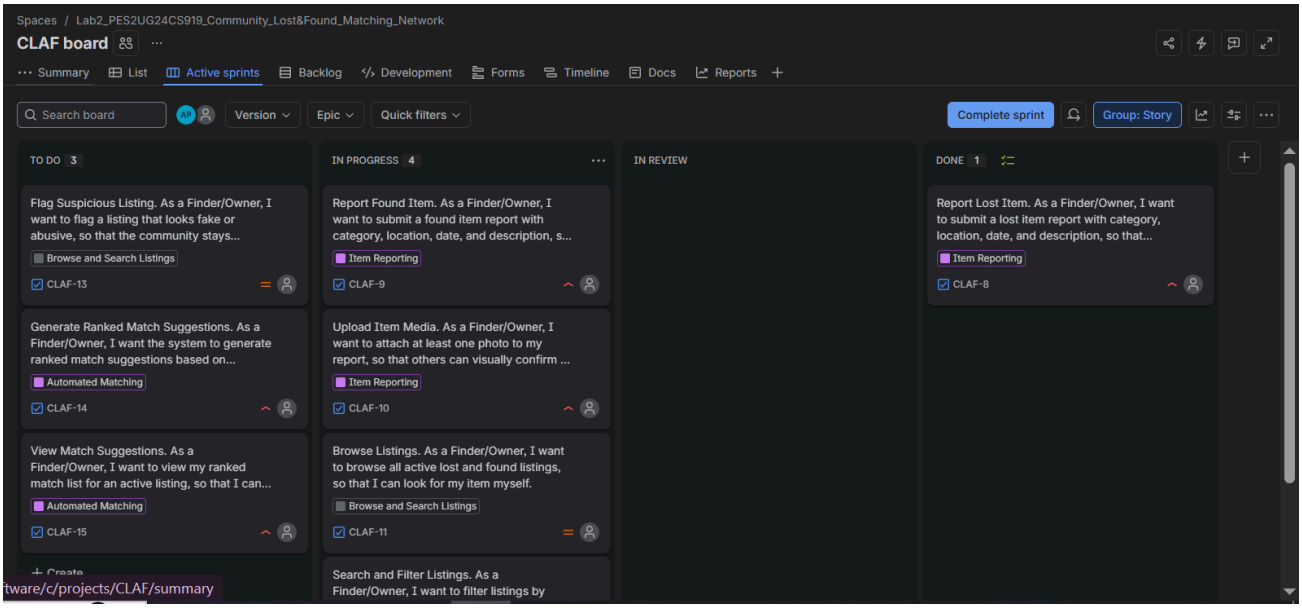

SPRINT 1:

1. Sprint 1 is created with 7 work items and a total of 17 story points.

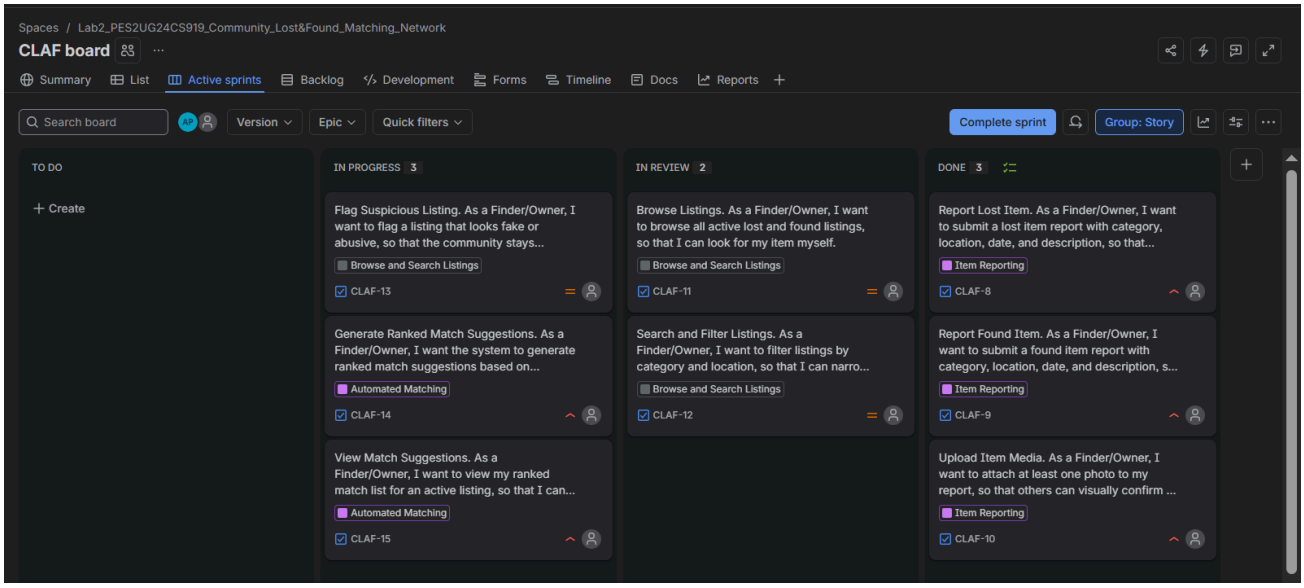

Sprint 1 is started with the goal of implementing the core functionalities such as: item reporting, browse and search listings, automated matching, claim and identity verification, notifications, community moderation and tracking performance and security

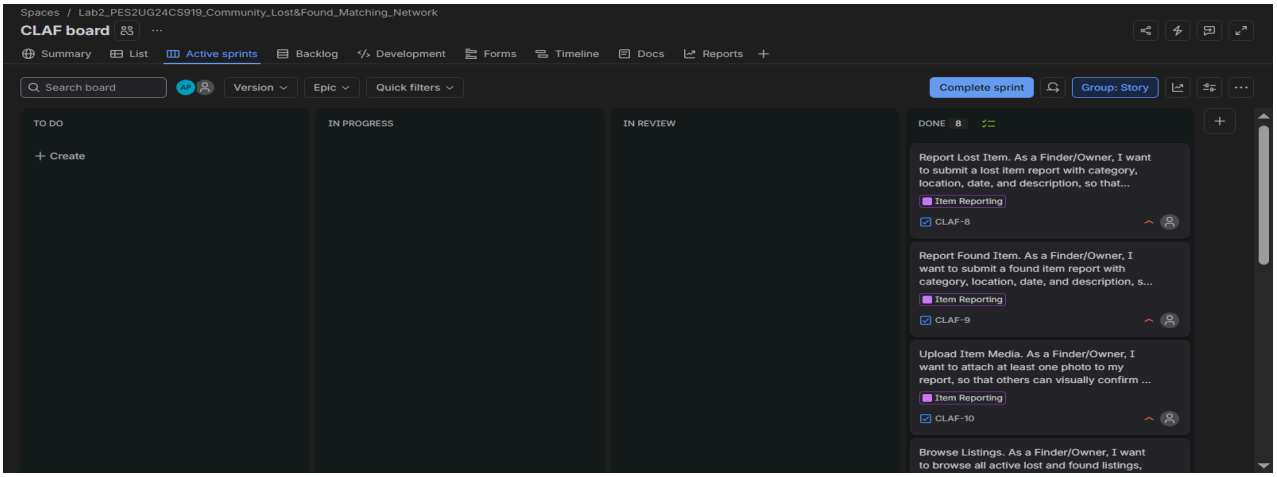

2. Sprint 1 shows work distributed across **To Do, In Progress, and Done**, demonstrating sprint progress across all 7 epics.

Sprint 1 progresses further as additional stories move toward completion

3. Sprint 1 reaches completion with all 8 planned stories marked as Done.

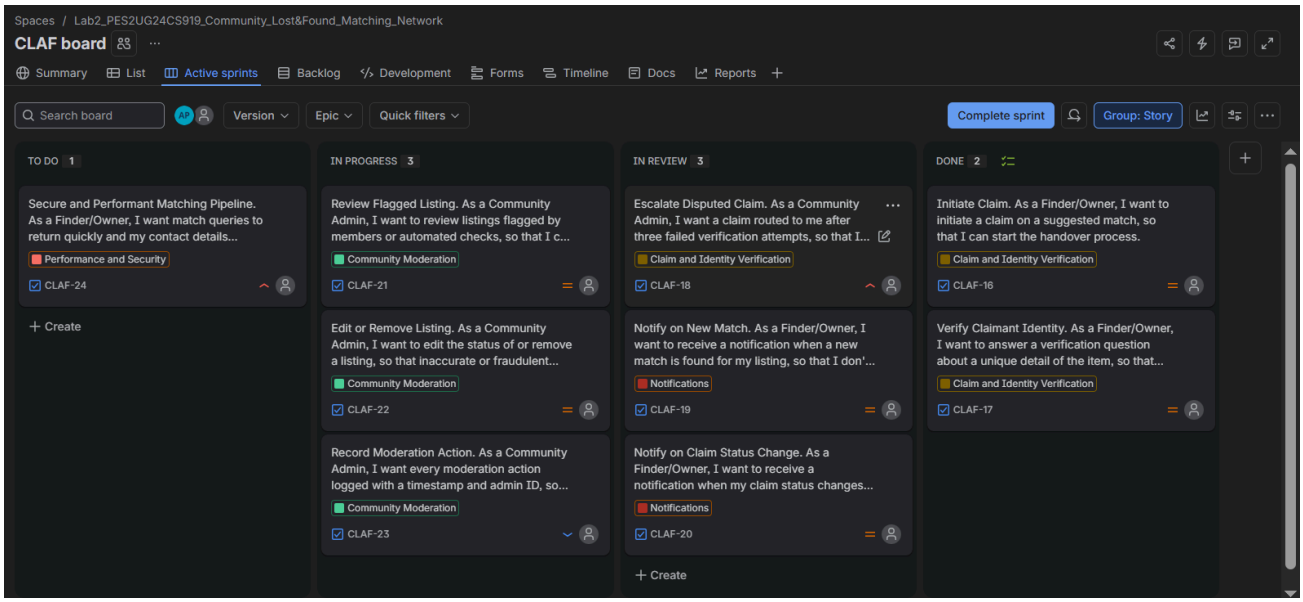

4. The Sprint 1 Burndown Chart shows the reduction of remaining story points throughout the sprint.

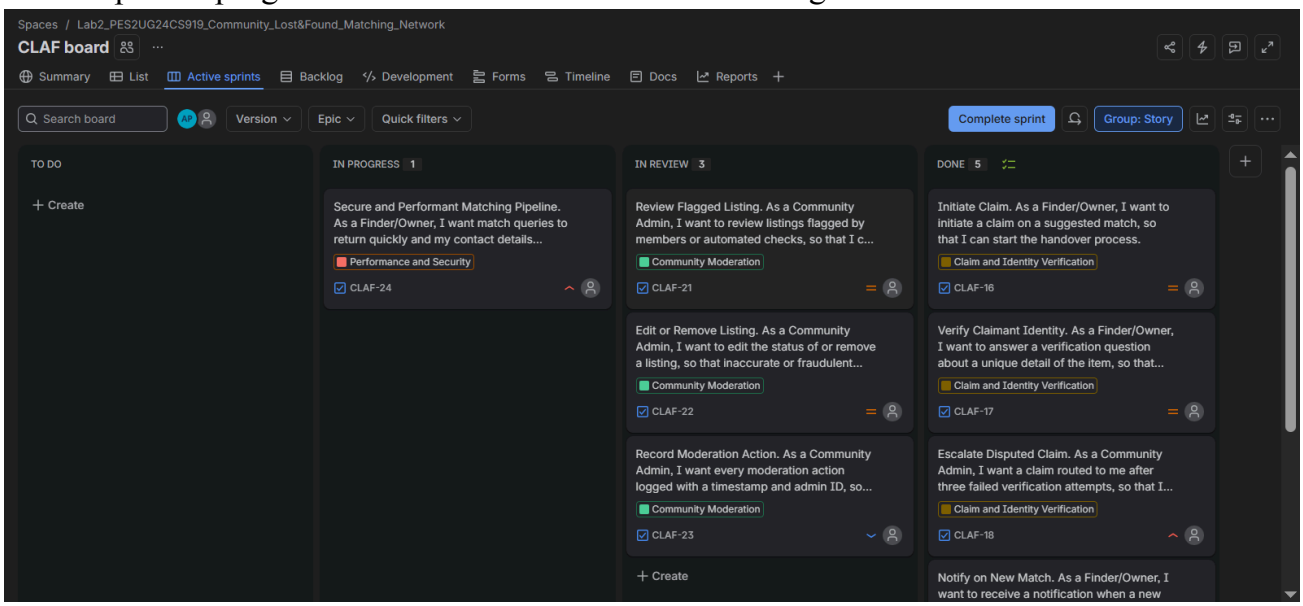

SPRINT2:

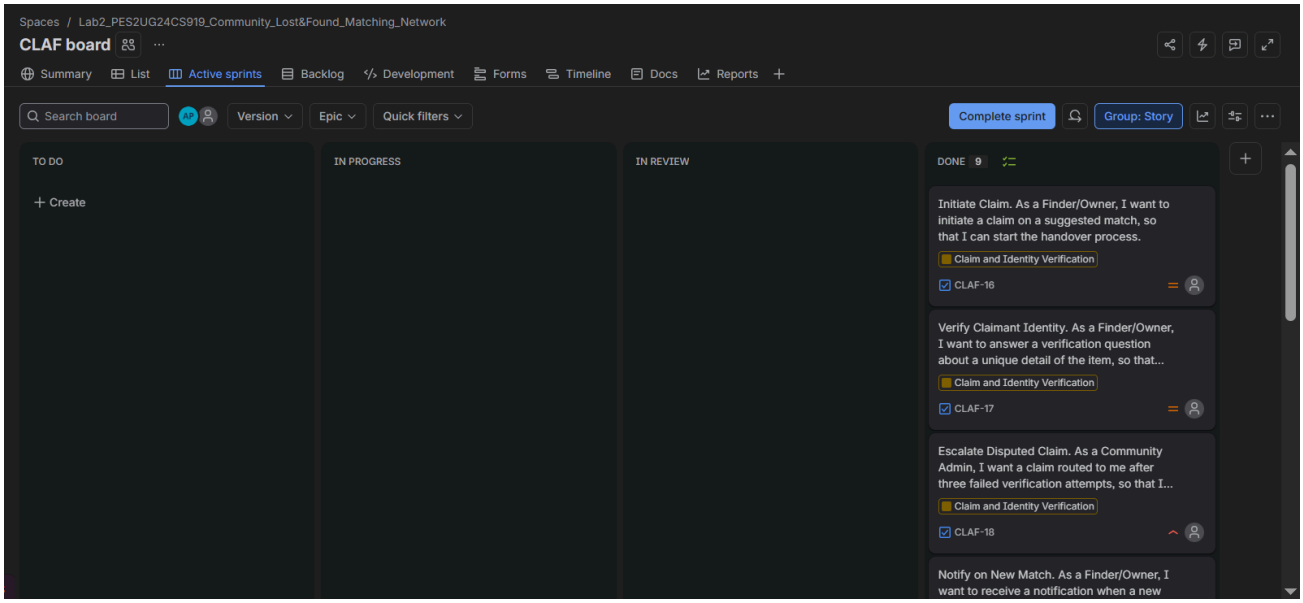

1. Sprint 2 begins with stories covering buyer approval, dispute handling, escrow protection, and auditing.

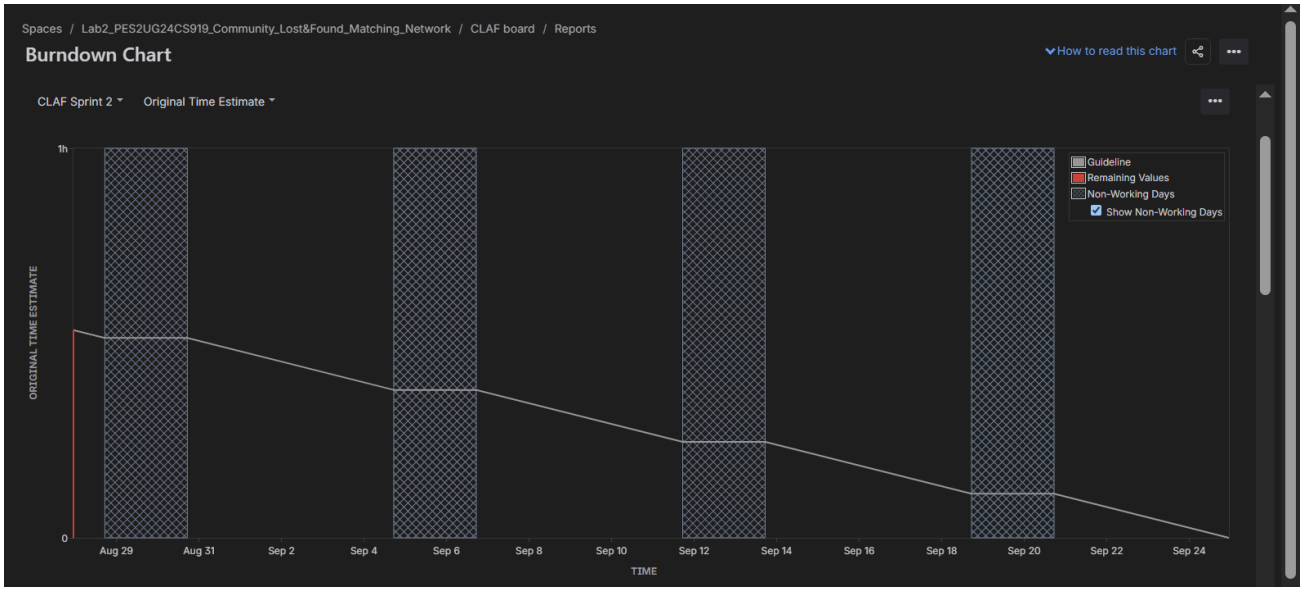

1. Sprint 2 progresses as stories are moved into In Progress and Done.

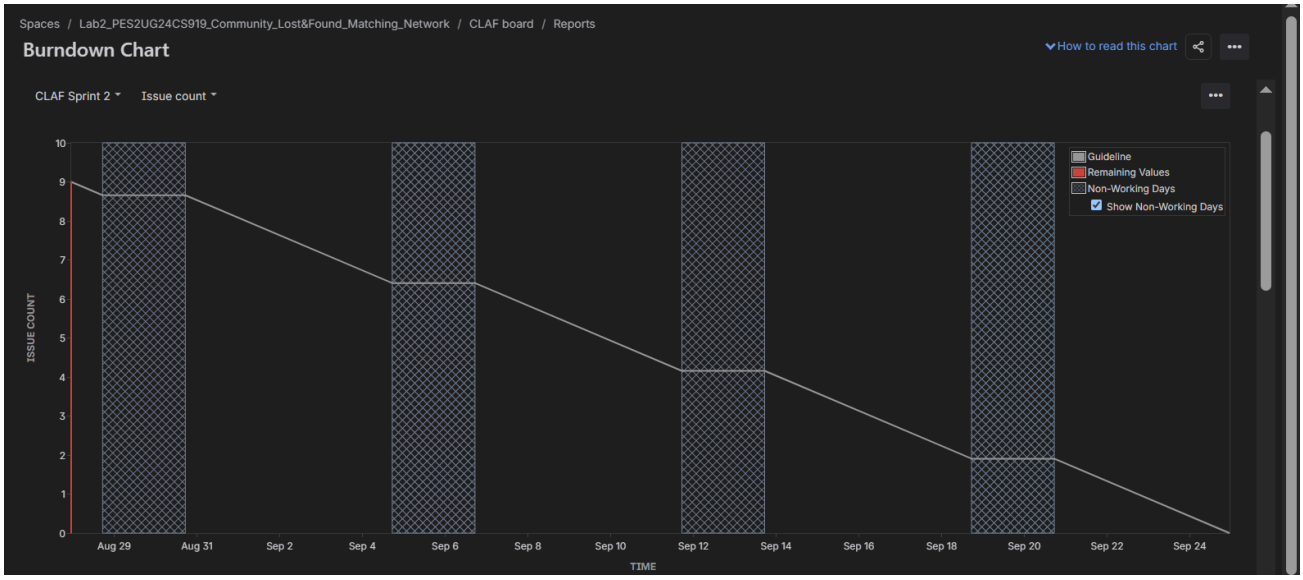

2. Sprint 2 reaches completion with all planned stories marked as Done.

2. The Sprint 2 Burndown Chart shows the reduction of remaining work toward completion.

Reflection Questions:

- **Did your estimations reflect the actual effort?**

  Generally speaking, yes - for the reporting and browsing stories, those were straightforward CRUD-shaped work and the 3 and 5 point calls felt right. The matching and verification stories were harder to size because there's no real backend behind the simulation, so a lot of the "effort" is imaginary complexity I was guessing at rather than effort. Story 3.1, generating ranked match suggestions, was the one I'd revise if I redid this. So, mostly yes, it did reflect actual effort if this were a real project situation.

- **Was your backlog well prioritized?**

  The high priority items lined up with the FRs already flagged as high in Lab 1, so ordering felt less like a fresh decision and more like carrying forward work I'd already done. Where it got a little shaky was Epic 6, moderation. I ranked those medium and low priority, but in a real setting, a Community Admin would probably want listing review earlier, since letting bad listings sit even for one sprint could undermine the whole trust model of the platform. If I resequenced, I'd pull Story 6.1 into Sprint 1.

- **How did your simulated sprint align with your plan?**

  It tracked reasonably closely since I was moving cards myself rather than waiting on a real team, so there was no actual blocker or delay to react to. That's the honest limitation of a solo simulated sprint, the plan and the execution are the same person, so misalignment mostly shows up as doubt in the form of "did I misjudge scope" rather than "did something external throw off timing." Sprint 1's 8 items around core reporting and matching felt like a coherent, shippable slice of overall work. Sprint 2 bundled verification, notifications, and moderation together which was heavier, and in a real team that’d probably be best when split into three sprints instead of one.

- **What insights did the burndown chart give about your team's capacity?**

  The biggest insight came from the chart breaking with respect to story points. Hitting a flat zero line on the Story Points filter(despite setting appropriate story points) while Issue Count still worked helped me understand what the estimation statistic setting does instead of just trusting the default. That's a real agile lesson too, a burndown chart is only as reliable as the config underneath it, a team could easily read a broken chart as "we're crushing it" or "we're stalled" when the real problem is probably a misconfigured field, and not representative of actual progress.
